

## The Bunkers, Kent and Newbury

# Let's get your servers out of the office

Are you looking to downsize your office? Right now, you might be busy working out your working from home arrangements. But there's something else to consider - where will your data go? We're in both Newbury and Kent, each home to a nuclear bunker from which Cyberfort runs its colocation service. Cost-effective, spacious and with great service, the Bunkers are above all a more secure alternative to on-premises server storage. So, if you're running out of space - we've got the perfect solution.

Let's take a look inside.

## What is colocation?

Colocation is when you rent off-site server capabilities. It typically includes additional services and saves you the trouble of maintaining your own server room.

## Why move your servers?

Whether you're moving to a more hybrid model or continuing to work from home, you no longer need the space you had before. Except for your valuable servers. Until you go back (or in case you don't), our colocation bunkers give you somewhere more secure to store them.

## Why choose Cyberfort?

Our server centres – we call them the Bunkers – are as secure as you'd expect, compliant and accredited. They're also cost-effective, spacious and come with great service. And why wouldn't you want technical and security staff looking after your data 24/7/365?

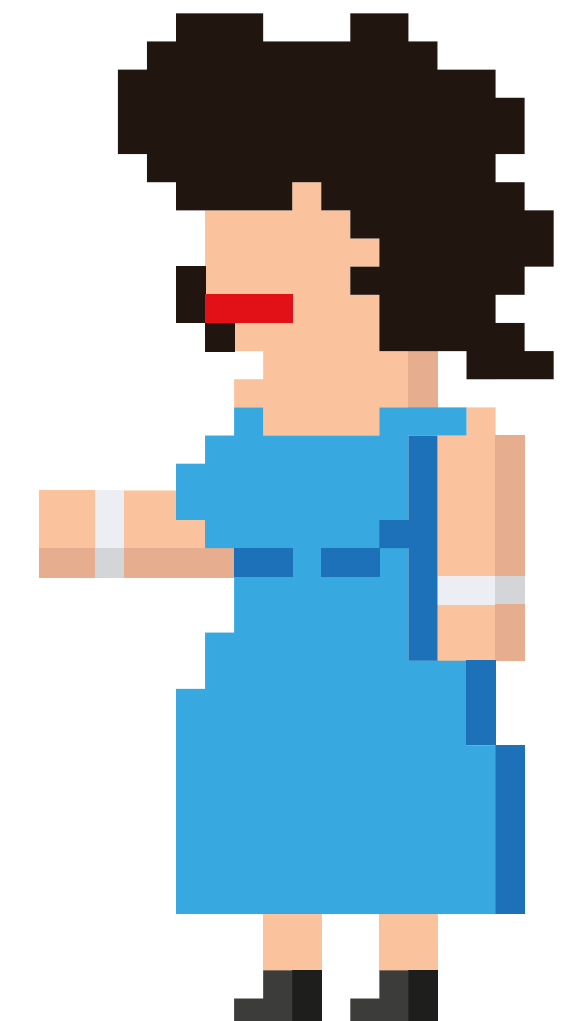

# About the Bunker

The Bunkers in Newbury and Kent are each fitted for colocation.

Businesses have been working from home for a while. If yours is one of them, you might be returning soon but to a slightly smaller space. In a less central location. With less room for lots of servers. It's all this that makes colocation an attractive option for businesses. We'd love to show you around.

### Secure colocation

- Choose from a variety of solutions – from quarter, half and full racks, through to fully dedicated environments
- Protect your servers with layered security measures, and satisfy the needs of your customers, investors, insurers and regulators
- Construct a bespoke suite for extremely sensitive servers, from materials that meet recognised loss prevention standards

### Secure colocation suites

- Design and build to your specific construction and security requirements – right down to the materials, layout or loss prevention standard
- Set up a private space not just for your servers, but for key ceremonies or specific transactions
- Reduce risk even further by moving your servers away from the shared data floor

### Managed colocation

- Get additional services like managed network infrastructure, perimeter security, secure server backup and more
- Bridge any skill gaps you might have – or pick and choose which parts of the service you want to manage yourself
- Trust your servers with Cyberfort and our strong technical expertise, plus our 24/7/365 service desk
